

Here is an updated prompt crafted to convey **all design details, spacing, colors, layout components, and step-by-step logic** directly in text so you don't need to upload any screenshots:

Copy & Paste Prompt for Replit:

Task: Re-style and restructure the **"Swap" section** and container layout of my crypto widget to match a sleek multi-step exchange widget design, while retaining my existing backend logic and dynamic admin panel fields.

1. Scope & Constraints

- **Apply updates ONLY to:** The **Swap** tab/function and the outer widget layout (desktop & mobile).
- **DO NOT TOUCH:** My **Convert** function or tab layout. Leave all Convert logic and UI exactly as it is now.
- **Backend & Admin Panel:** Do NOT break existing API calls or dynamic admin settings. The input fields rendered in Step 2 must continue to generate **dynamically** based on my admin backend settings.

2. UI & Design Specifications

A. Outer Layout & Container

- **Theme:** Dark mode UI with high-contrast elements (dark background surface #0F172A / #12131A, rounded cards #1A1D26, light/white typography).
- **Desktop Layout:** Two-column grid layout:
 - **Left Side (Widget Container):** Fixed-width dark rounded card (approx. 420px–460px wide, ~16px padding, border-radius ~16px).
 - **Right Side (Promo Banner):** Matching rounded card height featuring "Secure Cryptocurrency Exchange" text, payment provider icons (VISA, Mastercard, SEPA), and a "How does it work?" section with a "See more" action button.
- **Mobile Layout:** Single-column stacked layout (Widget on top, Promo banner underneath or hidden on small screens).

B. Navigation Header

- Top segmented toggle bar inside the widget card: [Swap | Convert].
- Highlighted active tab pill with a distinct dark grey/blue accent background.

C. Swap Step-by-Step Flow

- **Step 1: Swap Input View**
 - Header: "Swap Currencies".
 - Two stacked dark input cards:
 - **Top Card (You Pay):** Amount input field + currency selector dropdown (shows icon + symbol).
 - **Bottom Card (You Get):** Auto-calculated output field + currency selector

dropdown.

- Center swap direction arrow icon connecting both cards.
- Full-width primary CTA button at the bottom (Proceed -> or Next).
- **Step 2: Dynamic Receiving Method Details**
 - Header: "Receiving Method Details" with a clean horizontal accent line underneath.
 - **Dynamic Form Fields:** Render input fields dynamically according to my admin panel data (e.g., Account Holder Name, Bank Name, SWIFT Code, Account Number, Telegram Username, Phone Number, Card Number).
 - **Field Styling:** Dark inset input fields with faint borders, rounded corners (8px), soft grey placeholder text, bold light labels with red asterisks * for required inputs, and light copy-to-clipboard icons where applicable.
 - **Bottom Actions:** Two-button row featuring a secondary <- Back button on the left and a primary Next -> button on the right.
- **Step 3: Summary / Confirmation View**
 - Header: "Summary".
 - Compact card showing step summary: payment pair details, exchanged amounts, and receiving address/details block with copy buttons.
 - Action row with <- Back and final submission button.

3. Technical Implementation Requirements

- Implement modular CSS/Tailwind utility classes for all form inputs, tab buttons, borders, and paddings so the widget is pixel-perfect across desktop and mobile viewports.
- Ensure the dynamic form mapping component iterates over admin config fields seamlessly without breaking hardcoded field assumptions.
